

Phaetus Rapido Hotend

The printer currently uses a Phaetus Rapido for the hotend. It is the original model, *not* the Rapido 2, as it would have cost double the price for only a minor performance improvement. Additionally, the model purchased was the *Ultra*-high Flow model, which is identical to the standard model, except that it comes with an optional longer "volcano-style" hotend. Using the longer hotend would greatly increase flow rate, the standard Voron StealthBurner design does not account for the longer length and so it is currently not being used.
